Assistant Professor
National Institute of Science Education and Research

¹Slide ideas borrowed from Marc van Kreveld and Subhash Suri

Intersection Detection

- Determine pairs of intersecting objects?
 - Collision detection in robotics and motion planning.
 - Visibility, occlusion, rendering in graphics.
 - Map overlay in GISs: e.g. road networks on county maps.

Line Segment Intersection

- Let's first look at the easiest version of the problem:
- Given a set of n line segments in the plane, find all intersection points efficiently
- Naive algorithm?

Line Segment Intersection

- Let's first look at the easiest version of the problem:
- Given a set of n line segments in the plane, find all intersection points efficiently
- Naive algorithm? Check all pairs. $O(n^2)$.

Algorithm 1 FindIntersections(S)

Input: A set S of line segments in the plane.

Output: The set of intersection points among the segments in S .

- 1: **for** each pair of line segments $e_i, e_j \in S$ **do**
 - 2: **if** e_i and e_j intersect **then**
 - 3: report their intersection point
 - 4: **end if**
 - 5: **end for**
-

Algorithm 2 FindIntersections(S)

Input: A set S of line segments in the plane.

Output: The set of intersection points among the segments in S .

```
1: for each pair of line segments  $e_i, e_j \in S$  do  
2:   if  $e_i$  and  $e_j$  intersect then  
3:     report their intersection point  
4:   end if  
5: end for
```

- Question: Why can we say that this algorithm is optimal?

Line Segment Intersection

Line Segment Intersection

- The asymptotic running time of an algorithm is always input-sensitive (depends on n)

Line Segment Intersection

- The asymptotic running time of an algorithm is always input-sensitive (depends on n)

Line Segment Intersection

- The asymptotic running time of an algorithm is always input-sensitive (depends on n)
- We may also want the **running time to be output-sensitive**: if the output is large, it is fine to spend a lot of time, but if the output is small, we want a fast algorithm

Line Segment Intersection

- The asymptotic running time of an algorithm is always input-sensitive (depends on n)
- We may also want the **running time to be output-sensitive**: if the output is large, it is fine to spend a lot of time, but if the output is small, we want a fast algorithm
- If there are k intersections, then ideal will be $O(n \log n + k)$ time.

Line Segment Intersection

- The asymptotic running time of an algorithm is always input-sensitive (depends on n)
- We may also want the **running time to be output-sensitive**: if the output is large, it is fine to spend a lot of time, but if the output is small, we want a fast algorithm
- If there are k intersections, then ideal will be $O(n \log n + k)$ time.
- We will describe a $O((n + k) \log n)$ solution. Also introduce a new technique : **PLANE SWEEP**.

An Easier Problem:

- Given a set of intervals on the real line, find all overlapping pairs.

An Easier Problem:

- Given a set of intervals on the real line, find all overlapping pairs.
- Imagine a horizontal line passing over the plane from top to bottom, solving the problem as it moves

An Easier Problem:

- Given a set of intervals on the real line, find all overlapping pairs.
- Imagine a horizontal line passing over the plane from top to bottom, solving the problem as it moves
- The sweep line stops and the algorithm computes at certain positions : **EVENTS/ EVENT POINTS**

An Easier Problem:

- Given a set of intervals on the real line, find all overlapping pairs.
- Imagine a horizontal line passing over the plane from top to bottom, solving the problem as it moves
- The sweep line stops and the algorithm computes at certain positions : **EVENTS/ EVENT POINTS**
- The algorithm stores the relevant situation at the current position of the sweep line : **STATUS**

An Easier Problem:

- Given a set of intervals on the real line, find all overlapping pairs.
- Imagine a horizontal line passing over the plane from top to bottom, solving the problem as it moves
- The sweep line stops and the algorithm computes at certain positions : **EVENTS/ EVENT POINTS**
- The algorithm stores the relevant situation at the current position of the sweep line : **STATUS**
- The algorithm knows everything it needs to know before the sweep line, and found all intersection pairs.

An Easier Problem:

- Sort the endpoints and handle them from left to right; maintain currently intersected intervals in a balanced search tree \mathcal{T}

An Easier Problem:

- Sort the endpoints and handle them from left to right; maintain currently intersected intervals in a balanced search tree \mathcal{T}
 - Left endpoint of s_i : for each s_j in \mathcal{T} , report the pair (s_i, s_j) . Then insert s_i in \mathcal{T}
 - Right endpoint of s_i : delete s_i from \mathcal{T}

An Easier Problem:

- Sort the endpoints and handle them from left to right; maintain currently intersected intervals in a balanced search tree \mathcal{T}
 - Left endpoint of s_i : for each s_j in \mathcal{T} , report the pair (s_i, s_j) . Then insert s_i in \mathcal{T}
 - Right endpoint of s_i : delete s_i from \mathcal{T}
- There will be $2n$ many event points.

An Easier Problem:

- Sort the endpoints and handle them from left to right; maintain currently intersected intervals in a balanced search tree \mathcal{T}
 - Left endpoint of s_i : for each s_j in \mathcal{T} , report the pair (s_i, s_j) . Then insert s_i in \mathcal{T}
 - Right endpoint of s_i : delete s_i from \mathcal{T}
- There will be $2n$ many event points.
- At each event point we do two operations
 - Insert/Delete
 - Report intersection

An Easier Problem:

- Sort the endpoints and handle them from left to right; maintain currently intersected intervals in a balanced search tree \mathcal{T}
 - Left endpoint of s_i : for each s_j in \mathcal{T} , report the pair (s_i, s_j) . Then insert s_i in \mathcal{T}
 - Right endpoint of s_i : delete s_i from \mathcal{T}
- There will be $2n$ many event points.
- At each event point we do two operations
 - Insert/Delete
 - Report intersection
- Total time = Total insert delete time + Total time to report intersection

An Easier Problem:

- Sort the endpoints and handle them from left to right; maintain currently intersected intervals in a balanced search tree \mathcal{T}
 - Left endpoint of s_i : for each s_j in \mathcal{T} , report the pair (s_i, s_j) . Then insert s_i in \mathcal{T}
 - Right endpoint of s_i : delete s_i from \mathcal{T}
- There will be $2n$ many event points.
- At each event point we do two operations
 - Insert/Delete
 - Report intersection
- Total time = Total insert delete time + Total time to report intersection
- $2n * \log n + k$

Back to 2D Problem

Back to 2D Problem

Imagine a horizontal line passing over the plane from top to bottom, solving the problem as it moves

- **Question:** What are the event points?

Back to 2D Problem

Imagine a horizontal line passing over the plane from top to bottom, solving the problem as it moves

- **Question:** What are the event points?
- Maintain vertical order of segments intersecting the sweep line;

Back to 2D Problem

- Insert ℓ_1 , add the end point of ℓ_1 to the event queue

Back to 2D Problem

- Insert l_1 , add the end point of l_1 to the event queue
- Insert l_2 , Current order l_1, l_2

Back to 2D Problem

- Insert l_1 , add the end point of l_1 to the event queue
- Insert l_2 , Current order l_1, l_2
- Insert l_3 , Current order l_1, l_3, l_2 ,
 - Check whether l_3 intersects with l_1 or l_2 .
 - Insert intersection point of l_2 and l_3 into the event queue.

Back to 2D Problem

- Insert l_1 , add the end point of l_1 to the event queue
- Insert l_2 , Current order l_1, l_2
- Insert l_3 , Current order l_1, l_3, l_2 ,
 - Check whether l_3 intersects with l_1 or l_2 .
 - Insert intersection point of l_2 and l_3 into the event queue.
- Current order l_1, l_2, l_3 , insert intersection point of l_3, l_2 to the event queue.

Back to 2D Problem

- Insert ℓ_1 , add the end point of ℓ_1 to the event queue
- Insert ℓ_2 , Current order ℓ_1, ℓ_2
- Insert ℓ_3 , Current order ℓ_1, ℓ_3, ℓ_2 ,
 - Check whether ℓ_3 intersects with ℓ_1 or ℓ_2 .
 - Insert intersection point of ℓ_2 and ℓ_3 into the event queue.
- Current order ℓ_1, ℓ_2, ℓ_3 , insert intersection point of ℓ_3, ℓ_2 to the event queue.

. . . and so on . . .

When do the events happen? When the sweep line is at

- a left endpoint of a line segment
- a right endpoint of a line segment
- an intersection point of a line segment

A left endpoint of a line segment

- We use a balanced binary search tree with the line segments in the leaves as the status structure.
- Search and insert.

A left endpoint of a line segment

- We use a balanced binary search tree with the line segments in the leaves as the status structure.
- Search and insert.
- Should we find out intersection of l_6

A left endpoint of a line segment

- We use a balanced binary search tree with the line segments in the leaves as the status structure.
- Search and insert.
- Should we find out intersection of l_6
- At the time of insert l_6 is adjacent to l_4 and l_3 .

A left endpoint of a line segment

- We use a balanced binary search tree with the line segments in the leaves as the status structure.
- Search and insert.
- Should we find out intersection of l_6
- At the time of insert l_6 is adjacent to l_4 and l_3 .
- Check whether l_6 intersects with l_4 and l_3 or not, if intersects, insert the intersection points in the event queue.

A left endpoint of a line segment

- We use a balanced binary search tree with the line segments in the leaves as the status structure.
- Search and insert.
- Should we find out intersection of l_6
- At the time of insert l_6 is adjacent to l_4 and l_3 .
- Check whether l_6 intersects with l_4 and l_3 or not, if intersects, insert the intersection points in the event queue.

A right endpoint of a line segment

- Sweep line reaches right endpoint of a line segment: delete the line segment

A right endpoint of a line segment

- Sweep line reaches right endpoint of a line segment: delete the line segment
- After deletion of l_6 , l_3 and l_4 becomes adjacent.
- If l_3 and l_4 intersects insert the intersection point into the event queue.

Sweep line reaches an intersection point

Sweep line reaches an intersection point of l_i and l_j

- Exchange l_i and l_j in the order list.

Sweep line reaches an intersection point

Sweep line reaches an intersection point of ℓ_i and ℓ_j

- Exchange ℓ_i and ℓ_j in the order list.
- If ℓ_i and its new left neighbor intersects, then insert this intersection point in the event queue
- If ℓ_j and its new left neighbor intersects, then insert this intersection point in the event queue.

Sweep line reaches an intersection point

Sweep line reaches an intersection point of ℓ_i and ℓ_j

- Exchange ℓ_i and ℓ_j in the order list.
- If ℓ_i and its new left neighbor intersects, then insert this intersection point in the event queue
- If ℓ_j and its new left neighbor intersects, then insert this intersection point in the event queue.
- Report the intersection point.

- Before the sweep algorithm starts, we know all upper endpoint events and all lower endpoint events
- But: How do we know intersection point events??? (those we were trying to find . . .)
- Observe: Two line segments can only intersect if they are horizontal neighbors

- At each event constant many updates

- At each event constant many updates
- Since both the event queue and T are balanced binary search trees, handling an event takes only $O(\log n)$ time.

- At each event constant many updates
- Since both the event queue and T are balanced binary search trees, handling an event takes only $O(\log n)$ time.
- Total no of events are $O(n + k)$.
- The algorithm takes $O(n \log n + k \log n)$ time If $k = O(n)$, then this is $O(n \log n)$

- At each event constant many updates
- Since both the event queue and T are balanced binary search trees, handling an event takes only $O(\log n)$ time.
- Total no of events are $O(n + k)$.
- The algorithm takes $O(n \log n + k \log n)$ time If $k = O(n)$, then this is $O(n \log n)$
- Note that if k is really large, the brute force $O(n^2)$ time algorithm is more efficient

Area of Union of rectangles

- Given a layout in which objects are orthogonal polygons with sides parallel to the axes. The task is to the area covered by all the objects.

Area of Union of rectangles

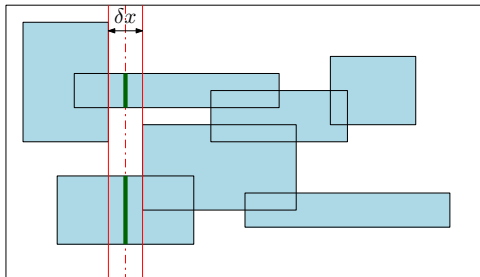

- Given a layout in which objects are orthogonal polygons with sides parallel to the axes. The task is to the area covered by all the objects.
- **PLANE SWEEP:** Keep track of the area that being swept.

Area of Union of rectangles

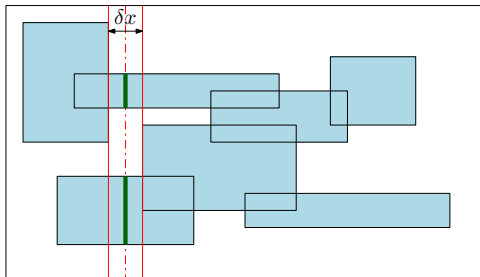

- Given a layout in which objects are orthogonal polygons with sides parallel to the axes. The task is to the area covered by all the objects.
- **PLANE SWEEP:** Keep track of the area that being swept.
- **EVENT POINTS:** Left and right end point of the rectangles.
- What is the area between any two sweep lines?

Area of Union of rectangles

- Given a layout in which objects are orthogonal polygons with sides parallel to the axes. The task is to the area covered by all the objects.
- **PLANE SWEEP:** Keep track of the area that being swept.
- **EVENT POINTS:** Left and right end point of the rectangles.
- What is the area between any two sweep lines?
- $\delta x \times y$ where y is the length of the intersection of the the rectangles with the sweep line.

Area of Union of rectangles

- Intersection of the the rectangles with the sweep line is a set of intervals.
- Thus the problem at hand becomes to maintain the intercepts. The y can change only at
 - The beginning of a rectangle.
 - The end of the rectangle.

Sum of the union of the intervals

- Naïve Method:

Sum of the union of the intervals

- **Naïve Method:**
- At each event point find out y by a sweepline method.
- Complexity $O(2n \cdot n \log n) = O(n^2 \log n)$
- How to maintain **sum of the union of the intervals** with respect to insertion and deletion.

Sum of the union of the intervals

- Sort the end points of the intervals.
- This will create a set of elementary intervals.

Sum of the union of the intervals

- Sort the end points of the intervals.
- This will create a set of elementary intervals.

Sum of the union of the intervals

- Sort the end points of the intervals.
- This will create a set of elementary intervals.
- Depending on which intervals are **ACTIVE** , a set of elementary intervals will be **ACTIVE** .

Interval-Tree

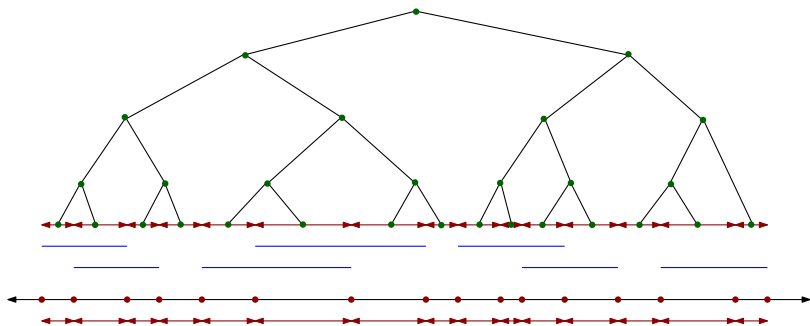

- We maintain a special data structure called the
INTERVAL-TREE

Interval-Tree

- We maintain a special data structure called the **INTERVAL-TREE**
- It is a balanced binary tree of the **ELEMENTORY INTERVALS**.

Interval-Tree

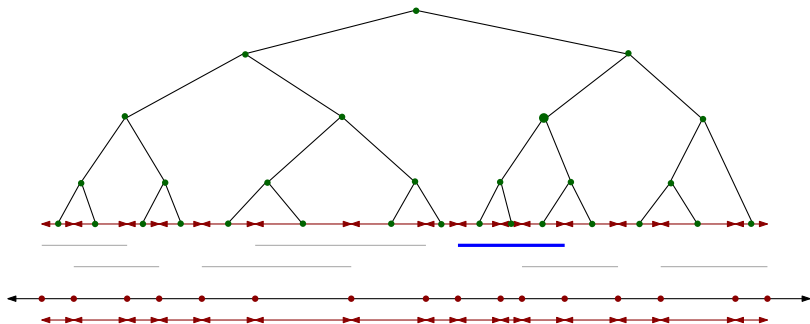

- We maintain a special data structure called the **INTERVAL-TREE**
- It is a balanced binary tree of the **ELEMENTORY INTERVALS**.
- Each node represents an interval.

Interval-Tree

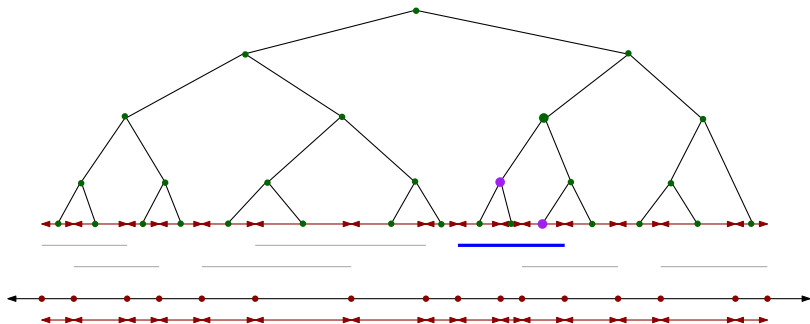

- How an interval is stored in the tree?

Interval-Tree

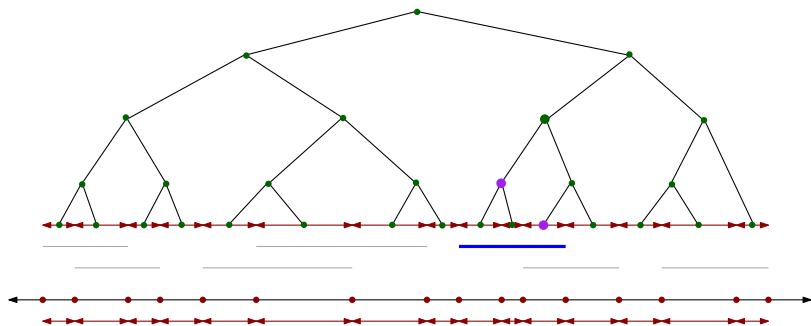

- How an interval is stored in the tree?
- Start with the root and find a split node.

Interval-Tree

- How an interval is stored in the tree?
- Start with the root and find a split node.

Interval-Tree

- **Claim:** Each interval is stored in $O(\log n)$ nodes.

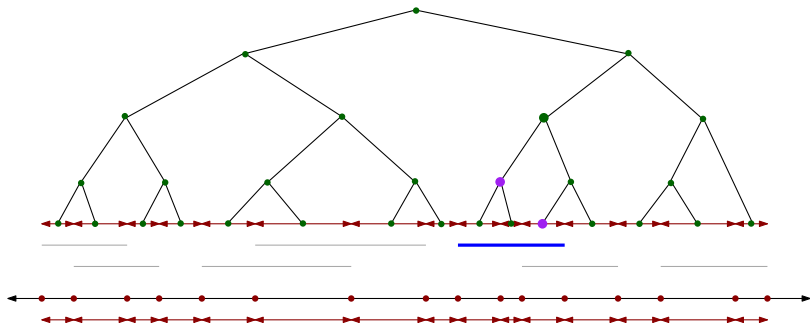

- **Claim:** Each interval is stored in $O(\log n)$ nodes.
- At each level there can be at most two node representing the interval.
- All of them have to be consecutive.

- **Claim:** Each interval is stored in $O(\log n)$ nodes.
- At each level there can be at most two node representing the interval.
- All of them have to be consecutive.

Interval-Tree

- Each interval can be inserted and deleted in $O(\log n)$ time.
- At each node we maintain the length of the active elementary intervals.

Interval-Tree

- Each interval can be inserted and deleted in $O(\log n)$ time.
- At each node we maintain the length of the active elementary intervals.

Interval-Tree

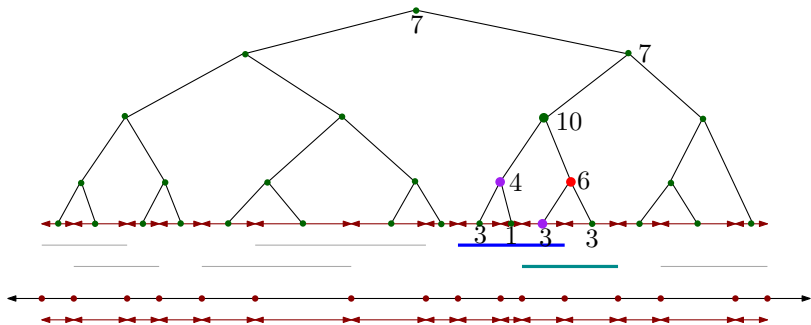

- Each interval can be inserted and deleted in $O(\log n)$ time.
- At each node we maintain the length of the active elementary intervals.

- Each interval can be inserted and deleted in $O(\log n)$ time.
- At each node we maintain the length of the active elementary intervals.

Interval-Tree

- Each interval can be inserted and deleted in $O(\log n)$ time.
- At each node we maintain the length of the active elementary intervals.

- Each interval can be inserted and deleted in $O(\log n)$ time.
- At each node we maintain the length of the active elementary intervals.

- $O(\log n)$ insert each takes $O(\log n)$ time.
- In time $O(\log^2 n)$ we can perform the updates.

- $O(\log n)$ insert each takes $O(\log n)$ time.
- In time $O(\log^2 n)$ we can perform the updates.
- Can be done in time $O(\log n)$ Homework

Sum of the union of the intervals

- In time $O(n \log^2 n)$ we can find out the area of the union of n rectangles.
